LÄGLER parquet laying tool

New, optimized design

For years, LÄGLER parquet laying tools have been standard tools for laying parquet floors. Numerous customer suggestions have led to the tool being completely redesigned. Features that have proved their worth were retained, but other important factors and details have been adapted to the high demands and requirements of parquet floor layers. One outstanding feature of the new parquet laying tool is its ergonomic shape which guarantees optimum handling. In connection with a new material, the new shape significantly increases the material strength and thus service life of the tool. Enlarged contact areas also ensure greater transmission of force. Another new feature of the LÄGLER parquet laying tool is the plastic tapping block fixed in place by a screw, making replacement much easier. The powder coating method used during production increases surface quality as well as tool durability. The parquet laying tool is available in the two lengths 43 cm and 55 cm.
